

Manage labor costs better with Productivity Manager.

TRACK ACTUAL STAFFING UTILIZATION AGAINST YOUR STANDARDS AND COMPARE TO EXTERNAL BENCHMARKS.

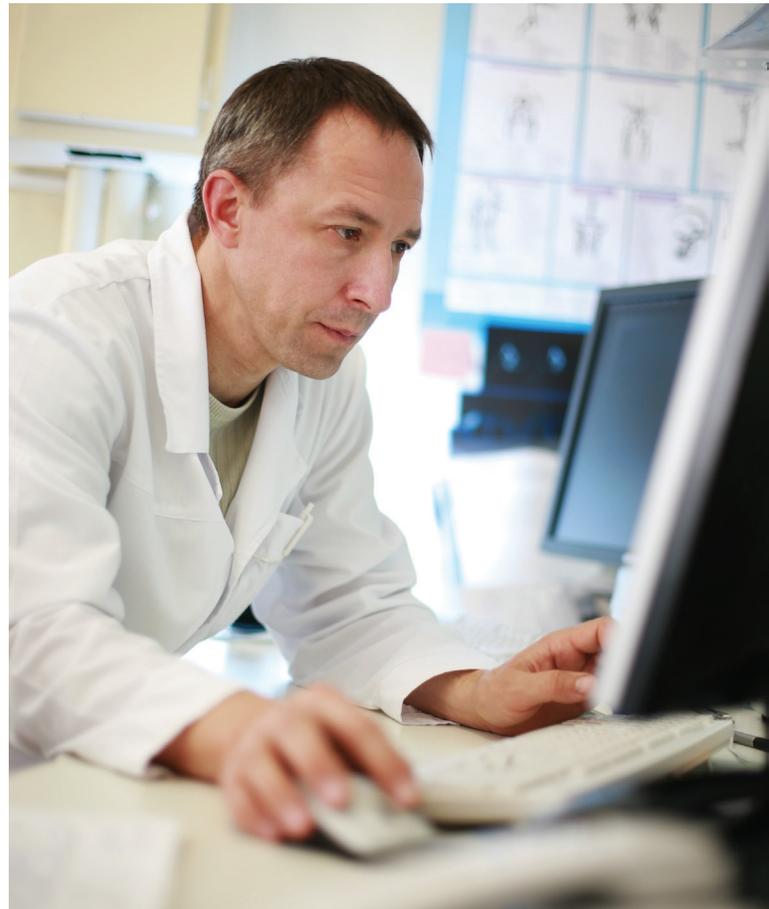

We understand how important it is to manage labor costs, typically the biggest single cost to an organization. It's also the one expense your organization can directly influence, when you have the right data. Systems need to have accurate answers to questions like, "What's the right staffing mix to deliver the best level of service to my patients, at the lowest cost?" Productivity Manager holds the answers to your labor cost challenges.

Establish expectations, recognize trends, and staff accordingly.

Recommending the right staffing mix at a given point in time is a complex process, but it's made easier when everyone from executives to department supervisors are working towards the same goal. Knowing the expectations makes it easier to recognize trends, and keep staff working within their credentials. With Productivity Manager, you'll benefit from native integration of the data with the operational budget and planning process, helping your teams make the best decisions in real time.

Track daily productivity reports.

Labor productivity changes constantly. Your department-level supervisors should be able to make daily decisions, and have monthly data to discuss with their executive teams. As an EPSi customer, you'll see your labor productivity reports side-by-side with supplemental information already in your database.

Get the full picture.

Productivity Manager is just part of an overall solution that provides insight into not only where you are, but where you are going and need to be. The pressure on your organization to handle changing market conditions is too great to trust tools that only give you superficial insights. Get the most robust solutions available, from the most trusted provider in the industry.

Get clarity. Go deep.

Healthcare delivery systems face increasingly complex demands on their financial organizations. The pressure is on to win while meeting new market requirements, from bundled payments, accountable care organizations and value-based care, to population health, increasing labor costs and the need to integrate across product lines. In today's market, a hospital's financial, operational and clinical leaders need to incorporate, analyze and utilize data to drive the organizational transformation required to succeed.

Manage your staffing variables, simply.

One of the biggest challenges of optimizing the staffing mix is the number of variables and data points that can make an impact. Having visibility into all of the variables to show true root cause and effect is critical to making reliable and accurate decisions. EPSi brings all of the variables and data together in one place so you can easily derive the insights needed on who, why, where, when and how you can optimize staffing mix to increase efficiency and lower costs.

With Productivity Manager, you know when a job class or department has a variance in their expected cost, hours, or number of FTEs. Even if costs are at or below the expected target or budget, a department manager can see additional opportunities to reduce costs. The manager can also see an uptick in patient volumes due to real-time events, like an unexpected flu virus outbreak, and can proactively plan for the optimal staff and mix needed to ensure costs are minimized.

EPSi is the only solution that offers the unique integration of deep patient data, planning and budgeting data, and labor productivity data to provide the insights crucial for lowering costs and improving quality of care.
